The adult population of Busselton, which is relatively closed and stable, has since 1966 been the subject of ongoing surveys, marked by accession rates in the order of 90%. The surveys entail health questionnaires, medical examinations and numerous biochemical and other health indices such as electrocardiograms. In particular, the occurrence of cancer and changes in smoking habits are under close scrutiny. The serum level of CEA, measured by microradioimmunoassay, was included in the 1969 and 1975 surveys. The 1969 survey results, including the association of raised CEA levels with increasing age and cigarette smoking and the weak predictability of CEA for development of cancer, have been reported. The 1975 survey involved 3,120 adults, and results are presented according to frequencies of persons with levels less than five ng per ml, regarded as normal, 5-10 ng per ml, and ten or greater ng per ml. According to these groupings the 1975 survey shows that: (1) CEA increases with age in both sexes; (2) CEA is strongly related to smoking habits and differences are seen between more than 15 and less than 15 cigarettes per day, and recent ex-smokers. Long-term ex-smokers are not affected and pipe smokers are marginally affected; (3) raised CEA is associated with increased risk of death, but it is not certain from the data whether the confounding effect of age has been accounted for; (4) statistics for CEA-associated cancers are being independently assessed and results are pending; (5) correlations between CEA values in the 1969 and 1975 surveys is now being analyzed.

EPIDEMIOLOGY OF MALE GENITAL TRACT CANCER

D.J. Jussawalla, Tata Memorial Hospital, Dept. of Surgery & Chemotherapy, *Dr. Ernest Borges Marg, Parel, Bombay 400012, Maharashtra, India*

A series of 1,003 male genital cancers (prostate 514, testis 182, penis 307) were recorded in Greater Bombay during 1964-72. The specific aims of the investigation are: 1. To study the natural history and epidemiology of these tumors; 2. to determine the morbidity and mortality from such tumors; 3. to study the practice of circumcision in relation to penile cancer in different religious groups; and 4. to determine whether any reasons can be ascertained for the low incidence of male genital cancer in Greater Bombay.

3.2659,
EPIDEMIOLOGICAL STUDY OF INCIDENCE, MORBIDITY & NATURAL HISTORY OF SOME TYPES OF CANCER, BY RELIGIOUS GROUP, IN THE BOMBAY AREA POPULATION

D.J. Jussawalla, Tata Memorial Hospital, Dept. of Surgery & Chemotherapy, *Dr. Ernest Borges Marg, Parel, Bombay 400012, Maharashtra, India*

A study carried out by Jussawalla and others (1970) examined the differences observed in the site incidence of cancer between the Parsi community and the total population of Greater Bombay. This investigation revealed disease differences of appreciable epidemiologic interest. Thus, cancers of the buccal cavity, pharynx, larynx, oesophagus and cervix uteri were less common in the Parsis. On the other hand, the Parsi rates were higher for sites such as the female breast, body of uterus, ovary, prostate and skin and for all leukemias. The purpose of this study is to determine the incidence of various types of cancer by religion. The numerical distribution of religions in Bombay is as follows: Hindus 4,110,746 (68.85%), Muslims 843,358 (14.13%), Christians 375,265 (6.29%), Parsis 64,667 (1.08%), Jains 244,721 (4.10%), Buddhists 284,303 (4.76%), and Sikhs 42,862 (0.71%) out of a total population of 6 million persons. Statistical analysis of the recorded data on cancer will be carried out as follows: (1) Crude and age-specific rates by sex, year and primary sites in various religious groups; (2) age-adjusted rates, as suggested by Doll and others, by sex and primary sites; (3) comparison of incidence rates for religious groups in Greater Bombay with those for other races in the United States and other countries.

PROSPECTIVE STUDIES ON CANCER EPIDEMIOLOGY BASED ON CENSUS POPULATION IN JAPAN

T. Hirayama, Ministry of Health & Welfare, National Cancer Center, Epidemiology Division, *5-1-1 Tsukiji, Chuo-ku, Tokyo 104, Tokyo, Japan*

To study the health consequences of selected risk factors including cigarette smoking, alcohol drinking, diet (rice, fish, meat, milk, green-yellow vegetables, soybean paste soup, pickles, hot tea), occupation, marital status, number of children, age at first marriage, length of breast feeding, etc., a prospective population study has been in progress in 29 Health Center Districts in 6 prefectures in Japan since the autumn of 1965. In total 265,118 adults, 122,261 males and 142,857 femals aged 40 years and over,

91-99% of the census population, were interviewed and followed by establishing a record linkage system between the risk factor records, a current residence list obtained by special and annual census, and death certificates. The 39,127 deaths, including 10,331 cancers, occurring during thirteen years of follow-up from 3,060,499 observed person-years, age-adjusted and age-specific rates for each cause of death were calculated by socio-economic status and by the above listed risk factors. High and low risk groups for cancer were identified. For instance, the risk enhancing effect of cigarette smoking and risk lowering effect of daily intake of green-yellow vegetables, especially on ex-smokers, was observed for lung cancer. The attributable risk of daily cigarette smoking for cancer of all sites was 31.8% and 5.2% respectively in males and females. Effect of daily meat intake on cancers of pancreas and breast was also observed. Study is still in progress (currently at 14 years of follow-up).

ECOLOGICAL AND PATHOPHYSIOLOGICAL STUDIES OF PRIMARY LIVER CELL CARCINOMA IN RELATION TO LOCAL THAI FOOD PRODUCTS

P. Migasena, Mahidol University, School of Tropical Medicine, Dept. of Tropical Nutrition & Food Science, *420/6 Rajavithi Rd., Bangkok 4, Thailand*

Primary liver cell carcinoma is one of the most common causes of mortality in Thailand, especially in the northeast region. The incidence rate is five times that of western countries. The age at diagnosis is generally younger than 40 and the youngest reported case was 11 years old. It is suggested that the cause may be associated with food. Plara is a fermented fish product which is prepared locally and consumed by Thai people throughout Thailand, particularly in the north and northeast. During the preparation of plara, which is sometimes stored for over a year or for years, secondary and tertiary amines are probably formed and these amines may react with nitrates or nitrites which are present as contaminants in salt or water to form nitrosamines which are known carcinogens. The main objectives of the present studies are to (1) bioassay by feeding the local food product to animals to observe the toxic effects; (2) investigate, both quantitatively and qualitatively, nitrosamines, nitrates and nitrites in Thai food products and (3) study by polyacrylamide gel electrophoresis and immunoelectrophoresis serum protein patterns and some single protein fractions such as proteinase inhibitor from clinically diagnosed primary liver cell carcinoma cases in comparison with other hepatic diseases, such as liver cirrhosis, hepatitis and opisthorchiasis in order to better understand the pathophysiology of the disease. At the same time, the studies are designed to determine the geographic, cultural and social relationship of this cancer with the food consumption patterns of the population.

THE FREQUENCY OF SKIN CARCINOMA IN THE REGION OF RIJEKA (YUGOSLAVIA)

N. Mohar, Clinic of Dermatovenerology, Actinotherapeutic Station, *D. Tucovica 15, c/o Clin. Hos. Braca Dr. Sobol, 51000 Rijeka, Yugoslavia*

The characteristics of 1,016 persons with cancer of the skin treated at Rijeka, Yugoslavia, in 1965-1974 have been analyzed. Representing 18% of all forms of cancer, 953 patients had solitary and 63 multiple lesions. Basal cell carcinoma was diagnosed histologically in 748 instances (67.6%), squamous cell carcinoma in 296 (26.7%) and mixed forms in 62 (5.6%). Basal cell carcinoma was more frequent in women (409), squamous cell carcinoma in men (181) due to a greater frequency of lip neoplasms (80). In 89.9% carcinomas were located on exposed parts of the body and only in 18% on covered parts. The frequency of the disease was highest among housewives (360 or 35.4%) who, in many instances, had migrated to the city from villages. There were a large number of seamen, fishermen (288 or 28.3%), laborers, longshoremen and masons. Farmers repesented only 10.2% or 104 cases. Previous trauma was noted in 314 cases (30.9%). The study continues.

PROSPECTIVE AND RETROSPECTIVE COHORT STUDIES OF MORTALITY AND MORBIDITY AMONG SWEDISH CHEMISTRY GRADUATES

R.G. Olin, Kungliga Tekniske Hogskolan, Dept. of Safety & Health, *S10044 Stockholm 70, Sweden*

The causes of death among chemists who belonged to a cohort of men who graduated from the School of Chemical Engineering at the Royal Institute of Technology in Stockholm during the years 1930-1960 were studied. The group was followed until the end of 1977. Results to date show a significant increase in cancers, particularly malignant lymphomas and brain and prostate neoplasms in comparison with the causes of death in the general population, as well as in a similar cohort of architects educated at the same school during the same period of time. The study is at present being continued prospectively. The surviving male chemists have been sent a questionnaire concerning exposures and health effects; the participation rate is about 85%.

CAUSES OF MORTALITY AND DISABILITY IN FERRO-ALLOY WORKERS

L.V. Pokrovskaya, Sverdlovsk Research Inst. of Hygiene of Labor & Occup. Dis., Dept. of Industrial Hygiene, *Repin 2, Sverdlovsk 620014, Russia, Union of Soviet Soc. Republics*

Previous work has shown that the mortality from cancer in workers handling chrome-containing ferroalloys is significantly higher than in the general population. These workers had a heavy exposure not only to chrome compounds but also to polycyclic aromatic hydrocarbons (PAH), especially benz(a)pyrene. The present study aims to explore the causes of death and disability among smelters of various ferroalloys (exposed not to chrome but to PAH), particularly from malignant lymphoma and leukaemia. The follow-up of the cohort began in 1955 and continued until 1974.

MULTIPLE PRIMARY MALIGNANT TUMOR SURVEY

M.P. Prior, Regional Cancer Registry, *c/o Queen Elizabeth Med. Ctr., Birminghan B15 2TH, England, United Kingdom*

An analysis of population-based data, collected at the Birmingham Regional Cancer Registry, is being carried out to determine whether there is any evidence of an increased risk of a second primary over that of a first, in terms of either site-specific associations or high-risk groups. The results may help to define aetiological factors in tumour development and to identify individuals 'at risk' who will benefit from increased surveillance. The method of analysis is similar to previous surveys in that an index site is selected, and observed numbers of second primary tumours are compared with expected numbers computed from incidence rates for the regional population. Special consideration has been given to fundamental methodology related to coincidental diagnoses and to the sequence of tumours. The emphasis has been, therefore, on 'site-pair' analysis, that is on investigating each sequence for a pair of sites, in contrast to the conventional approach which considers one index site in relation to all second primary sites. A major survey of bilateral breast cancer over a period of nearly 30 years has been undertaken and the interrelationships between breast and female reproductive sites have been investigated. Current work includes analyses for lung in association with male reproductive sites, and also with bladder. Future projects will include the addition of large bowel tumours to the spectrum of paired analyses.

EPIDEMIOLOGICAL ANALYSIS OF LARGE BOWEL CANCERS BY SUBSITE DISTRIBUTION AS EXEMPLIFIED BY AGE & SEX PARAMETERS OF DIAGNOSIS & SURVIVAL

J. Powell, Regional Cancer Registry, *c/o Queen Elizabeth Med. Ctr., Birminghan B15 2TH, England, United Kingdom*

Variations in morbidity between the sexes and at different ages could indicate possible aetiological factors, provided there is no bias due to incomplete registration or inaccurate diagnosis. Registration in the West Midlands has been virtually complete for over fifteen years and the region has a high standard of medical of care so that even in patients too advanced for treatment there are facilities for an accurate assessment of the primary site. Moreover, in a population of 5.2 millions, over 2,000 cases of large bowel carcinoma are registered each year. Hence chance variations due to small numbers are minimised. Fortunately a single anatomical site code has been in use for the whole period and the subdivisions are sufficiently fine to permit examination of incidence rates by finer divisions of the colon than is possible with the present ICD code. Preliminary examination of incidence rates by age, sex and site of primary indicates in some cases marked similarities and in others marked differences between different segments of both the colon and rectum.

TUMORS IN CHILDREN - SEX- AND AGE-SPECIFIC INCIDENCE RATES IN RELATION TO HISTOGENESIS

J. Powell, Regional Cancer Registry, *c/o Queen Elizabeth Med. Ctr., Birminghan B15 2TH, England, United Kingdom*

Tumors in children differ sharply from those of the adult, particularly in the systems of the body in which they most commonly occur. Examination of sex- and age-specific incidence rates (for single years from birth) indicates the well-known marked variations during the first decade of life, although from age ten onwards the difference between childhood and adult cancer becomes one of quantity rather than quality. A method of classification according to histogenesis has been developed and, since the datta are from a population-based registry, variation in the age at onset appears to provide a useful modell for studying the relationship between the different types of malignancy and possible aetiological factors, the organs affected depending in some types on the gestational age of exposure.

FREQUENCY OF SELECTED CANCERS

W. Isarangkul Na Ayuthya, Mahidol University, School of Medicine, Dept. of Pathology, *Bangkok, Thailand 7*

A computerized tumor data base has been implemented to permit instant retrieval of sellected diagnoses. At present all the tumor data from 1974 to 1978 have been processed. A project has been designed to study relative frequencies and age distributions of primary cancers of all sites from 1974 to 1978, with an emphasis on female genital tract cancers. Computer programs have been prepared to facilitate automatic tabulation of the frequencies of specific types of cancers as well as the overall fre-

quency of all cancers of a particular site. Age distribution will also be obtained automatically.

DEMOGRAPHIC CANCER STUDIES IN NORTHERN SWEDEN

L.G. Larsson, Regionsjukhuset, Dept. of Oncology, *90185 Umea, Sweden*

Northern Sweden has some interesting features for geographical and epidemiological cancer studies as it contains several well separated and, from the socioeconomic and industrial point of view, different regions. There exist towns with a very low degree of industrialization, others being heavily industrialized, large rural areas and some rather specific industrial sites such as the mining districts in Norrbotten and Vaesterbotten. The study is based on morbidity and mortality data from the Swedish Cancer Registry and the Swedish Death Registry and will cover the years 1959-1971. The first part of the project involves calculation of age-adjusted incidences for different cancer sites for comparison by small geographic regions (towns, communes, parishes) in the three most northern counties (Vaesternorrland, Vaesterbotten and Norrbotten). Commune-based age-adjusted incidence rates have so far been calculated for lung cancer and female breast cancer. In both cases significant differences between communes were found which are now the subject of further studies. Incidence data for other cancers will also be produced. The findings concerning female breast cancer have been published in Swedish Society of Medical Radiology. Proc. No. 8, 1977 and Acta Radiol. Oncol. 17: 497, 1978 and the findings concerning male lung cancer and female breast cancer will soon be published in Nordic Council for Arctic Medical Research, Report 22: 15, 1978. An atlas containing data for all more frequent cancer types will probably be published during 1980. Work continues.

PREVALENCE OF ASBESTOSIS, PLEURAL CHANGES AND MALIGNANT NEOPLASMS IN BLACK EX-MINERS AND FEMALE COBBERS

W.O. Harrison, South African Dept. of Health Welfare & Pensions, National Centre for Occupational Health, Dept. of Occupational Medicine, *P.O. Box 4788, Johannesburg 2000, South Africa*

In 1973 the National Research Institution for Occupational Diseases was approached to determine the state of health of ex-employees of the asbestos mining industries, especially those using Cape crocidolite. Based at the St. Michael's Hospital at Bathlaros, near Kuruman, in the North West Cape Province, a small clinic was established, staffed by a doctor, nurse and a driver who knew the country and were well known in it. With the assistance of the Bureau of Census and Statistics mining company records were investigated. By August 1977 some 1500 ex-employees had been traced. At present attention is concentrated on investigating a cohort of ex- and current employees exposed during 1957-1962.

STUDY OF VALIDITY OF CLINICAL EXAMINATION AND X-RAY MAMMOGRAPHY AS SCREENING TESTS FOR BREAST CANCER (ABBREV)

J. Chamberlain, Inst. of Cancer Research, Division of Epidemiology, *Clifton Ave., Sutton SM2 5PX, England, United Kingdom*

The aim of this study is to determine the error rates of clinical examination and mammography in screening for breast cancer and to measure reproducibility between two observers performing the same test. Women over 40 years of age are screened in a well-women clinic where, in addition to a medical history, they have two independent examinations of the breasts, one by a nurse and one by a doctor, and mammography, using the low dose medichrome film system. Mammograms are read independently by two radiologists. Women in whom an abnormality is detected are referred for surgical assessment, biopsied when necessary, and in those in whom cancer is found, follow-up is continued for at least 15 years. To get some idea of the false negative results (the cancers which would be missed by annual re-examination), all women are asked to attend for rescreening at six-month intervals for the first year and then to have one further re-examination two years after initial entry into the study; this, it is hoped, will help determine optimum screening frequency. To date about 6,000 screenings have been done in 2,000 women and 32 cancers found. The economic study is trying to assess both the costs and the benefits of screening. Not only are the health service costs of providing screening taken into account, but also all costs resulting from referral to hospital for surgical opinion and biopsy and costs of treating cancers found. These will be compared with conventional management of breast disease in a system without screening. Benefits are being assessed by trying to obtain a measure of the value which women themselves put on the screening service. It is hoped that eventually some measure of the effectiveness of screening in reducing mortality can also be included.

INFECTION WITH HEPATITIS B VIRUS IN RELATION TO HEPATOCELLULAR CARCINOMA

A.C. Bayley, University of Zambia, School of Medicine, Dept. of Surgery, *P.O. Box 2379, Lusaka, Zambia*

Hepatocellular carcinoma is the most common tumour of Zambian men. A recent study of 19 patients treated in Lusaka and of 40 control villagers living in the Eastern Province showed that all patients and 63% of controls showed serological evidence of past infection with hepatitis B virus (HBV), usually antibody to surface antigen. The objectives of this study are: (1) To record the prevalence of HB surface antigen (HBsAG), antibody to this antigen, and antibody to core antigen in the serum of selected Zambians of all age groups; (2) to investigate serial blood samples from apparently healthy individuals with serological evidence of past or present infection with HBV; (3) to examine cord blood at birth for evidence of exposure to HBV and to follow up the babies of HBsAG-positive mothers to determine if and when serological evidence of infection develops; (4) to investigate the pattern of antibody production to surface and core antigens following exposure to infection at work (surgeons) and by transfusion (children); (5) to compare the prevalence of HBsAG and antibody to core and surface antigens in persons in villages where hepatoma has or has not been observed in the last five years; (6) to identify men with a high risk of developing hepatocellular carcinoma for regular screening. Control villages and 'hepatoma' villages have been selected close to a well established mission hospital. It is planned to attempt to obtain three serum samples from each of 500 individuals over the age of three years during a period of two consecutive years.

FOLLOW-UP OF PATIENTS TREATED FOR MALIGNANT DISEASE

M.R. Alderson, Inst. of Cancer Research, Division of Epidemiology, *Clifton Ave., Sutton SM2 5PX, England, United Kingdom*

This study will follow adolescents and young adults treated with increasingly powerful schedules to quantify the mortality from second malignancies and to check whether there is any evidence of a carcinogenic or teratogenic effect following conception. For both these groups of patients the original medical records will be abstracted; this will include detailed data on initial and subsequent treatment. Where patients have been followed until death, the cause of death will be obtained, whilst those known to be alive will be included, particular effort being made to trace patients presently lost to follow-up. Survivors from adolescence will be interviewed when they have reached child-bearing age, and a marital history will be obtained including data on any conception that occurs. Information about miscarriage, stillbirth, or children born with congenital abnormalities will be sought; liveborn children will be followed to identify the incidence of malignancy.

COLLATION OF ROUTINE STATISTICS

M.R. Alderson, Inst. of Cancer Research, Division of Epidemiology, *Clifton Ave., Sutton SM2 5PX, England, United Kingdom*

This project will collate, analyse, present and interpret routine mortality and morbidity statistics for England and Wales and selected other countries to provide (1) specific statistics required for particular studies carried out by the divisions of epidemiology, and (2) a background to consideration of the epidemiology and health care problems of cancer. Use will be made of national mortality (annual statistics, and decennial supplements on occupational and area mortality); incidence data (including unpublished analyses of occupation); hospital treatment data (from the hospital inpatient inquiry); workload and facilities (from health and personal social service statistics). Equivalent material from other national offices of vital statistics, WHO and IARC will be examined for selected countries. Many of the issues being considered require data from a non-malignant disease (e.g., time trends in stomach cancer in relation to large bowel cancer, peptic ulcer and other alimentary disease); statistics for about 30 non-malignant diseases will therefore be included in the project.

HISTORICAL DATA BASE FOR ONE COMPANY IN THE PETROLEUM INDUSTRY

M.R. Alderson, Inst. of Cancer Research, Division of Epidemiology, *Clifton Ave., Sutton SM2 5PX, England, United Kingdom*

This project will set up a comprehensive file to examine future queries about the influence of work in a particular process upon mortality from specific diseases. Specific job histories will be obtained for all individuals who have worked at two large refineries for more than one year since these refineries were established. A comprehensive job history will be abstracted and the file will accumulate at the same time data on the plants and processes at each of the refineries including designation of the major variation in the raw materials, intermediaries, and products from each process. Individuals leaving the industry will be traced and the intention is to provide death details for all individuals who have died. This file of data will be primarily used as a computer-based retrieval system to check specific queries about health-risks from various processes. The primary approach will be to relate observed mortality to expected mortality taking into account age, sex, calendar period, and location in the country.

LEUKEMIA INCIDENCE AMONG WORKERS EXPOSED TO BENZENE

M.B. Aksoy, Istanbul Universitesi, Faculty of Medicine, Section of Hematology, *Bayezit, Istanbul, Turkey*

Further follow-up of persons in work places where aplastic anemia and leukemia associated with benzene exposure occurs, continues. During the period 1967-1969 44 cases of leukemia were noted in addition to nine patients with malignant lymphoma, five with carcinoma of lung, three with multiple myeloma, three with myeloid metaplasia and two with paroxysmal nocturnal hemoglobinuria.

EPIDEMIOLOGICAL STUDY OF ACUTE CHILDHOOD LEUKEMIA (ABBREV)

L. Zannos Mariolea, University of Athens, Blood Research Lab., Dept. of Pediatrics, *Odos Panepistimiou 30, Athens 608, Greece*

Retrospective studies of acute childhood leukemia in Greece have shown an increased occurrence of new cases during the spring months and a significant yearly variation in the percentage of non-lymphoblastic forms. The main objectives of the present study are: (1) Characterization of the seasonal distribution of acute lymphoblastic leukemia (ALL) and acute non-lymphoblastic forms; (2) search for clustering of cases in space and time and clustering in time of cases with ALL which have a leukocyte count over 20,000 per mm3; (3) determination of the frequency of occurrence of the chloromatous form of acute leukemia (this variant is increased in Africa and Turkey); (4) estimation of frequency of leukemias, lymphomas, neuroblastomas and other malignant tumours among hospital admissions and of glucose-6-phosphate dehydrogenase (G-6-PD) deficiency and beta-thalassaemia trait among children with acute leukemia. Do these traits confer increased resistance against acute leukemia?

MALIGNANT NEOPLASMS IN TUBERCULOSIS PATIENTS

R. Steinitz, Israel Center for Registration of Cancer & Allied Diseases, *18 20 King David St., Jerusalem 91000, Israel*

A unique opportunity of having two population-based registries under one roof was used for a preliminary investigation of tuberculosis and lung carcinoma which suggested that tuberculosis patients are at a higher risk of developing lung cancer. Possible causes for the high risk were discussed: scar carcinoma, the effect of large amounts of radiation (diagnostic procedures) and the carcinogenic effect of anti-tuberculosis drugs. If radiation is a cause of higher risk, the bulk of the resulting lung carcinomas will have appeared by now, as diagnostic and therapeutic procedures have changed. On the other hand, anti-tuberculosis drugs, especially isoniazid, which has been shown to have carcinogenic effects in animals, have now been in use for a probably sufficient length of time to show their specific carcinogenic effects, not necessarily limited to lung cancer, in tuberculosis patients. The purpose of the study is to re-examine the risk of tuberculosis patients of developing lung and other cancers and to look for differences in the cancer experience of tuberculosis patients according to changes in diagnostic and treatment policies. This is a record linkage study based on the Israel Cancer Registry and the Israel Tuberculosis Registry, supplemented by information from hospital and regional chest clinic records. The Tuberculosis Registry has approximately 55,000 names, starting in 1948, and also includes patients diagnosed before this date. The information on the tuberculosis patients will be extracted from individual records, from the Tuberculosis Registry, hospitals and chest clinics. Information on validation of diagnosis of tuberculosis, date of diagnosis of tuberculosis, localization of the tuberculous process, type and periods of anti-tuberculosis therapy, anatomical site and histology of cancer, date of diagnosis of cancer, activity of the tuberculosis at the time of the diagnosis of the tuberculosis and at the date of diagnosis of the cancer and cause of death will be sought.

COMPILATION AND ANALYSIS OF INTERNATIONAL CANCER MORTALITY STATISTICS

M. Segi, Segi Inst. of Cancer Epidemiology, *Yomeicho 2-5, Mizuho-Ku, Nagoya 467, Aichi, Japan*

In previous publications, the statistics of international cancer mortality were compiled and analyzed from the data printed in the World Health Statistics Annuals published by WHO. Our most recent publication is 'Age-Adjusted Death Rates for Cancer for Selected Sites (A-Classification) in 51 countries in 1974', February 1979. The next issue of 'Age-Adjusted Death Rates for Cancer for Selected Sites', in which age-adjusted death rates of cancers (buccal cavity and pharynx, esophagus, stomach, intestine except rectum, rectum, larynx, lung, bones, skin, breast, uterus, prostate, leukemia, lymphatic and hematopoietic tissue, etc.) in 46 countries in 1975 will be calculated, is now being prepared. The cumulative and age-adjusted death rates from cancer by sites in about 20 countries from 1950 to 1970 have also been computed, and cancer mortality trends analyzed. 'Ratio of Cumulative Death Rates and Age-Adusted Death Rates from Cancer by sites in 1960, 1970, to those in 1950, 1960', analyzes the increase and decrease of cumulative or age-adjusted death rates from cancer by sites during each decade of the 1950s and the 1960s. Based on these data, the correlations between mortality or incidence rates of cancer by sites in varous countries are being computed.

PROSPECTIVE STUDY IN RELATION TO OCCUPATIONAL EXPOSURE TO VINYL CHLORIDE

C.P. Tuinman, Shell Nederland Raffinaderij B.V., *Vondelingenweg 601, Rotterdam, Netherlands*

Vinyl chloride (VC), under normal temperatures and pressures of gas, can easily be polymerized to polyvinyl chloride (PVC), a white solid material. Apart from fire and explosion risk and a quickly appreciated narcotic effect, acro-osteolysis and soft tissue changes have also been described. Following an epidemiological study by Maltoni in 1974, reporting a cluster of cases of angiosarcoma of the liver in men who had previously worked as cleaners of reactors, a prospective study on VC-workers in this polymerization plant has been set up, comprising the tracing of medical data on previous VC-workers and a biannual physical and biochemical investigation of the present VC-population. Findings are related to the degree of VC-exposure as measured either by personal monitoring or fixed point air sampling.

THE EFFECT OF CHANGING DIETARY HABITS ON ESTROGEN PROFILES IN GREECE

D. Trichopoulos, University of Athens, School of Medicine, Dept. of Hygiene & Epidemiology, *Odos Panepistimiou 30, Athens 609, Greece*

Diet is one of the factors that may be responsible for the different incidence of breast cancer in urban and rural areas of Greece. If estrogen fractions are important in the aetiology of breast cancer, then diet should have an effect on the estrogen profiles. Urine and blood samples were collected from about 120 student nurses who came to Athens from rural areas to study nursing. Since the diet in the School for Nurses is different from that in the rural areas of Greece, third year students should be different from first year students with respect to estrogen profiles. Blood lipids were also measured because their relation to diet seems established.

STUDY OF RETINOBLASTOMA IN JAPAN AS A POSSIBLE POPULATION MONITORING SYSTEM FOR ENVIRONMENTAL MUTAGENS

T. Sugahara, Kyoto University, School of Medicine, Dept. of Experimental Radiology, *Yoshida-Konoecho, Sakyo-ku, Kyoto 606, Kyoto, Japan*

Because an increasing number of environmental mutagens have been detected by laboratory screening methods, the need to monitor human population directly for mutational risk has been emphasized by many geneticists. Recent studies by Knudson offer hope that certain malignant neoplasms might be used to assess somatic mutation rates. According to Knudson, the age at first diagnosis of these diseases may be related to the annual somatic mutation rate. Thus the data on the age at first diagnosis of unilateral and bilateral retinoblastoma have been collected throughout Japan. Since 1975 the data have been obtained by a nationwide registry of the disease in cooperation with the Ophthalmology Society of Japan. A first report suggesting an increase in mutation rate in Japan has been published (Mutation Research 30, 137, 1975). The study continues.

ASPECTS OF CANCER OF THE UTERINE CERVIX IN JAMAICA

V. Persaud, University of the West Indies, Dept. of Anatomical Pathology, *Kingston 7, Jamaica*

The crude incidence of cervix cancer (39.4 per 100,000 per annum) in Jamaica is among the highest in the world. The university departments of pathology, social and preventive medicine and obsterics and gynecology have been undertaking studies on the incidence, aetiology, early detection and morphology of uterine cervix cancer in Jamaica. Incidence figures are obtained from the Jamaica Cancer Registry, Dept. of Pathology, U.W.I., for a well-defined metropolitan population with adequate diagnostic facilities. Early detection by cytology screening in family planning clinics has shown a prevalence of 5.7 per 1,000 women whereas the rate in a low-income, high-risk, general population of 'well' women was 18.0 per 1,000. This discrepancy appeared to be due to the fact that the family planning women were of low parity (para 0-3) and therefore were not at high risk of developing cervix cancer since both groups were matched for age, race and socioeconomic background. A retrospective interview study was carried out on 300 histologically proven cases of cervical carcinoma and 390 'well' controls matched for age, race, and social class. The controls were drawn from a low-income, high-risk general population of women who were cytologically negative for cervix cancer. The questions asked concerned their marital status, number of pregnancies, age at first pregnancy and first coitus, number of coital partners and the circumcision status of these partners and sexual hygiene. The statistically significant factors were grand multiparity, promiscuity, poor sexual hygiene and early age at first coitus and first pregnancy. Studies on the epidemiology and early detection of cervix cancer in Jamaica are still progress.

SEROEPIDEMIOLOGICAL STUDIES OF HERPES VIRUS TYPE-2 AND CARCINOMA OF THE CERVIX IN ISRAEL

S. Leventon Kriss, Ministry of Health, Central Virus Lab., *P.O. Box 8255, Tel Aviv, Israel*

The relationship between genital herpetic infection and squamous cell carcinoma of the uterine cervix has been substantiated by sero-epidemiological studies and by evidence of virus persistence in cervical tumor cells. Most studies proving the association between cervical carcinoma and HSV-2 were done in populations with high risk rates for this malignancy. Jewish women are at low risk for this disease. It was, therefore, considered interesting to compare the Jewish population studies with those in other demographic groups, namely Christians and Muslims in Israel.

SPORADIC RETINOBLASTOMA IN RELATION TO PARENTAL AGE AND SEASONAL VARIATION

E. Matsunaga, National Inst. of Genetics, Dept. of Human Genetics, *Shizuoka-ken, Yata 1111, Mishima 411, Japan*

Follow-up investigations of progeny of survivors of sporadic retinoblastoma revealed that they comprise two etiologically distinct groups, hereditary and non-hereditary. All bilateral cases belong to the hereditary group and they are due to dominant germinal mutations, while the majority (90-95%) of sporadic unilateral cases are non-hereditary, and the cause appears to be the same mutational event in the somatic (retinoblast) cells. Although a few investigations (including ours) suggest that paternal age may affect the occurrence of sporadic bilateral but not unilateral cases, the evidence is as yet not very convincing. We intend to clarify this point, together with the possible effect of seasonal variation upon the presumed somatic mutations. Data concerning about 400 sporadic cases of retinoblastoma which occurred in from 1970 to 1975 in Japan have already been analyzed, and new cases (approximately 100 per year) will be collected over the next several years.

CHILDHOOD LEUKEMIA IN NORWAY 1963-1979

P.J. Moe, Universitetet i Trondheim, Dept. of Paediatrics, *7000 Trondheim, Norway, Norway*

Information about all cases of childhood leukemia diagnosed in Norway during the period 1963-1979 has been collected by contacting hospitals, particularly all pediatric departments, and for the first years - all the departments of internal medicine as well. Information has also been obtained from the National Cancer Registry as cancer registration is compulsory in Norway. Information was obtained as to the type of leukemia, year of diagnosis and survival time. The first part of this study has already been published. The aim of the second part of this study is to register all current cases of childhood leukemia with emphasis on cell-type, treatment regimen, results of therapy, and possible sequelae of the use of intermediate dose levels of methotrexate for almost all cases of lymphocytic leukemia diagnosed in Norway after 1975.

CAUSES OF DEATH IN THE DIFFERENT QUARTERS OF GENOA

R. Puntoni, Universita degli Studi di Genova, Inst. de Oncologia, Dept. of Epidemiology, *Viale Benedetto 15, Pad. B, 16132 Genoa, Italy*

The city of Genoa (816,872 inhabitants) is subdivided into 25 quarters. The socioeconomic and environmental situation of these quarters is very heterogeneous and there are different levels of air pollution. The 20,000 deaths which occurred in the years 1970-71 are being analyzed by the quarter of residence, the cause of death and the last occupation. The purpose of this investigation is to define possible relations between environment (different levels of air pollution), occupation and cause of death, with particular reference to cancer of the respiratory tract.

RELATIONSHIP BETWEEN LEUKEMIA AND EXPOSURE TO DIAGNOSTIC RADIATION

T. Majle, National Inst. of Hygiene, Dept. of Radiation Protection & Radiobiology, *24 Chocimska St., 00791 Warsaw 36, Poland*

The Tri-State Leukemia Study in U.S.A., 1962-1963, showed an excess of leukemias in adult males associated with an increased frequency of x-ray examinations. The purpose of the present study is to validate the results of the Tri-State Leukemia Study and to estimate exposure and dose of x-rays in 1,000 leukemia patients and in 1,000 controls chosen by random sampling from the Polish population. A retrospective survey provides information on the number and kind of x-ray examinations during the past 20 years. Information obtained from patients and controls is confirmed in hospitals, polyclinic records and archives. Exposure and dose of x-rays will be compared in both groups. A pilot study in Warsaw of 225 leukemia cases and 419 controls was completed in 1978. Some of the results show that the radiation load in leukemia patients may be higher than in relevant control groups. The results in children seem to indicate that children with leukemia were subjected to a higher number of x-ray examinations than the controls.

LEUKEMIA IN KENYA

E.G. Kasili, University of Nairobi, School of Medicine, Dept. of Medical Pathology, *P.O. Box 30588, Nairobi, Kenya*

Little is known about leukemia in Africa. Following a preliminary study (MD thesis covering period 1975-1979), this project proposes to study various aspects of leukemia in the Kenyan community. The incidence of the disease in Kenya will be determined, based on community studies of Kiambu and Machakos districts, which have so far shown the highest leukemia rates (although these may be influenced by easy access to Nairobi, with the highest concentrations of medical facilities in the country). Factor(s) which may contribute to the high frequency of myeloid leukemias, twice as prevalent as the lymphocytic types, such as background terrestrial or solar radiation, medicinal herbs, agricultural insecticides, the high carrier rates of HBsAg, and the relevance of genetic markers will be examined. Immunogenetic marker studies of the African population afflicted by leukemia, as well as in vitro studies of the leukemic cell growth kinetics, will be carried out to establish whether the very advanced stage of disease at presentation is due to lateness on the part of the patients in seeking medical advice or whether the disease in genuinely more agressive than in Caucasian populations.

BCG VACCINATION AND LEUKEMIA

L. Katz, Israel Center for Registration of Cancer & Allied Diseases, *18 20 King David St., Jerusalem 91000, Israel* (00680)

The possibility that the reported non-specific immunity conferred by BCG may have some influence in the prevention of leukemia in children is being investigated. In Israel a unique opportunity presents itself for studying the incidence of leukemia in BCG vaccinated children and in a non-vaccinated control group: since 1955 routine BCG vaccination of newborns has been carried out in all maternity wards in Israel - with the exception of the Jerusalem hospitals, where it was never introduced. The incidence of leukemia in children born in Israel since 1955, diagnosed after 1960 (the year the Israel Cancer Registry was founded) and up to the age of ten will be studied. Two hundred and sixty-three cases of leukemia in children have been identified. Their places of birth are now being ascertained.

NITRATE LEVEL IN DRINKING WATER AND GASTRIC CANCER

L. Juhasz, Szabolcs Szatmar County Hospital, Policlinic Unit, *44 Voeroeshadsereg u. 68, H4401 Nyiregyhaza, Hungary*

Stomach cancer is very common in Hungary. Shallow well water in the County Szabolcs-Szatmar very often has a high nitrate content. As part of a larger study the possible relationship between incidence of stomach cancer, nitrate level of drinking water, occurrence of methemoglobinemia cases and geographical distribution by soil types is examined. This analysis and comparison of Hb-values of pregnant women from the year 1975 onwards is in progress. Analyses of urine from selected places will be performed in the Bacterial Metabolism Research Laboratory, London. The first results were presented at the 6th IARC Meeting on Analysis and Formation of N-Nitroso Compounds, 16-21 October, Budapest, Hungary, and will be published shortly.

LONG-TERM TRENDS IN STOMACH CANCER MORTALITY AMONG KRAKOW REGION INHABITANTS

W. Jedrychowski, Akademia Medyczna w Krakowie, Inst. of Social Medicine, Dept. of Epidemiology, *Ul. Kopernika 7, 31034 Cracow, Poland*

The aim of the study is to compare mortality from malignant gastrointestinal neoplasms in groups of inhabitants living in four city districts differing in their demographic features and nutritional habits. The analysis is based on death certificates and interviews regarding dietary habits carried out in representative samples of the inhabitants. The results of a preliminary study based on a 1974 survey show higher mortality rates for all causes, and for gastrointestinal neoplasms in particular, in the center of the city, with the exception of mortality due the stomach cancer in women, than among the suburban population. Mortality rates due to gastrointestinal neoplasms of the stomach, liver, gallbladder and pancreas, colon and rectum were also high in men living in the newly developed part of the city. The differences in the consumption patterns of basic food products failed to explain fully the observed divergence between the mortality rates. However, the higher mortality rates in the center of the city could be explained to some extent by the higher atmospheric pollution level.

EPIDEMIOLOGY OF MALIGNANT TUMORS IN CHILDHOOD - PROGNOSIS OF WILMS' TUMOUR

Z. Erdos, Semmelweis Orvostudomanyi Egyetem, Dept. of Paediatrics, *Ulloi Utca 26, Budapest, Hungary*

The frequency of malignant neoplasms, especially Wilms' tumour, has been followed since 1947 in the First Dept. of Paediatrics of the Semmelweis Medical School, Budapest. No increase in the number of malignant tumours was found, a finding consistent with data from other countries. In this period, considerable improvement in the prognosis of Wilms' tumour, recovery in 50-70 percent of the cases has been noted; one patient with cured Wilms' tumour has been followed up for 36 years. Observations continue. Over the next 2 years it is intended to record the exact geographical sites where children with cancer are found. In adults it has been found that the highest frequency in Hungary occurs in the regions bordering on Austria. In the Transdanubian region in Hungary the number of cancer cases on the southern shore of the Lake Balaton is higher than in other parts of the country; the highest frequency of Down's Syndrome was also noted in this region.

GENETIC POLYMORPHISMS IN HIGH AND LOW RISK BREAST CANCER FAMILIES

F.J. Cleton, Nederlands Kankerinstituut, Div. of Genetics, *108 Sarphatistraat, Antoni van Leeuwenhoekhuis, 1066CX Amsterdam, Netherlands*

The objective of this study is to select a group at high risk of developing breast cancer in the population by means of certain genetic markers. Families with a high incidence of breast cancer have been investigated for a battery of genetic markers, including blood groups, serum groups, HL-A antigens, red cell isoenzymes and chromosome bands. Linkage studies were carried out using the Edwards Computer Program. Studies on plasma prolactin levels in the members of these families were also undertaken. In the first crude analysis of the data, evidence for only a weak linkage between a susceptibility gene for breast cancer and HL-A was found. In order that significant evidence for linkage may be obtained, the number of families must be increased. The material from study carried out by Dr. H. Lynch and Dr. Mary C. King is added to the data and analyzed for linkage. The studies of prolactin regulations continue.

DISTURBANCES OF CARBOHYDRATE-METABOLISM AND ADIPOSITAS IN PATIENTS WITH CARCINOMA OF THE CORPUS UTERI AND THE BREAST

C.B. Goecke, Luisenhospital, Dept. of Obstetrics & Gynecology, *5100 Aachen, Federal Republic of Germany*

Women with either endometrial cancer or breast cancer constituted an experimental group. For this group epidemiological data and data on accompanying illnesses, diabetes mellitus and adipositas, were collected. For comparison, a group of women without cancer constituted a control group.

Data on 369 patients with endometrial cancer and 178 patients with breast cancer were collected. The control group provided data on 884 women. All data were analyzed by computer.

The highest incidence of endometrial cancer appears among women between the ages of 55 and 59 in the postmenstruation period. The graph of breast cancer has two peaks. One maximum appears before the menopause (between the ages of 45 and 49). This rate decreases during the menopause itself (50 to 54 years old). The second maximum appears in women between the ages of 55 and 59 (after the menopause).

The rate of endometrial and breast cancer among the nulliparae in the experimental group was significantly higher than in the control group.

The incidence of manifest diabetes mellitus appears to be significantly higher than in the control group. The number of patients who had glucosuria and were suspected of having diabetes mellitus and the number of patients with latent diabetes mellitus were significantly higher than in the control group.

Potential diabetes mellitus in the control group was higher than in the experimental group.

Adipositas in women with endometrial cancer was significantly more common than in the control group women.

Manifest diabetes mellitus in the group of patients with breast cancer is also significantly more common than in the control group. The same result was seen in the group of patients who had glucosuria and were suspected of having diabetes mellitus. The rate of latent and potential diabetes mellitus was found to be higher in the control group than in the experimental group. Adipositas was also significantly more common in the experimental group of patients with breast cancer than in the control group.

TESTIS NEOPLASMS - CENTRAL REGISTRY AND COLLABORATIVE STUDY

W.E. Vahlensieck, Universitat Hospital of Urology, *Venusberg, 5300 Bonn, Nordrhein Westfalen, Federal Republic of Germany*

This registry collects information on patients with testis neoplasms. Particular attention is given to previous history, influence on risk of maldescended testis including effect of hormonal treatment and surgery and the age at which therapy was given. The influence of testis neoplasms on fertility will be examined.

ECOLOGICAL ANALYSIS OF CANCER MORTALITY IN LOWER SAXONY

M. Pflanz, Medizinische Hochschule Hannover, Institut fuer Epidemiologie und Sozialmedizin, *Karl Wiechert Allee 9, D3000 Hannover 61, Federal Republic of Germany*

The study aims to detect relationships between cancer mortality (1968 and 1971) and socioeconomic or environmental factors by multivariate analysis. The sex-specific age-standardized data will be correlated with about 70 socioeconomic variables. Spatial relationship between chemical plants, lead smelters and other environmental hazards on one hand, and counties with high cancer mortality for specific sites on the other hand, will be examined. The study method is similar to that used in the analysis of cancer mortality in the United States counties.

MALIGNANT DISEASES IN GREENLAND

N.H. Nielsen, Kobenhavns Universitet, Inst. of Forensic Medicine, Dept. of Forensic Pathology, *Frederik den Femtes Vej 11, DK2100 Copenhagen OE, Denmark*

This is an epidemiological study of total cancer incidence in Greenland as well as incidence of all specific types of malignancy. Records of all malignant cases diagnosed in this century are reviewed for medical and demographic information. The aim of the project is primarily to evaluate possible spatial or geographical gradients of frequency and to identify possible risk factors or risk groups. Part of the work has been published.

INCIDENCE OF BRONCHIAL CARCINOMAS IN MINERS IN THE SAARLAND

G. Dhom, Universitaet des Saarlandes, Universitaetskliniken, Pathologisches Institut, *6650 Homburg Saarlands, Federal Republic of Germany*

It is known from English and American investigations that coal miners have a lower mortality from bronchial carcinoma than the rest of the male population. The aim of this study is to see whether similar findings can be obtained for the miners from the Saarland. For this purpose, data available in the Cancer Registry of the Saarland and the health insurance company (Knappschaftskrankenkasse) will be used.

STUDIES OF MORTALITY IN AN INSTITUTION FOR AGED INVALID PATIENTS

P. Berthaux, Hopital Charles Foix, Service de Geriatrie, *Ave. de la Republique, 94200 Ivry sur Seine, France*

For the past eight years a necropsy has been done as often as possible for all patients dying in the institution (2,200 beds). Causes of death and associated pathology are investigated and compared with the clinical and biological data obtained during the life of the patients. It is proposed to identify high risk groups on the basis of previously collected data on immunodeficiency, age at menopause, etc.

ETIOLOGICAL FACTORS IN CANCER OF UPPER RESPIRATORY AND DIGESTIVE TRACTS

J. Brugere, Fondation Curie, Service de Chirurgie Cervico Faciale et ORL, *11 rue Pierre et Marie Curie, 75231 Paris Cedex 5, France*

Four main groups of neoplasms (oral cavity, oropharynx, larynx and hypopharynx) are being analyzed. A comparative study is carried out with special reference to occupation, dental status, smoking and drinking habits, precancerous lesions, sex and age. This information will be compared for the four groups and for ENT Department outpatients without evidence of neoplasm.

CANCER MORTALITY IN FRANCE - STUDY OF TIME AND SPACE DISTRIBUTION IN RELATION TO SOCIO-ECONOMIC FACTORS (1954-1964)

M. Brunet, Inst. National de la Sante et de la Recherche Medicale, Section Cancer, *5 rue Gaston Latouche, c/o Centre Rene Huguenin, 92211 St. Cloud, France*

After the development of a statistical and computing tool for processing cancer mortality data in France (INSERM monographs - years 1968-1970) providing rates per 100,000 by department, site, sex and age, standardized to several reference populations (France, Europe, world), possible correlations with the socio-economic, vital and geographical data

which are available in France for 1954-1974 will be sought. To this end, the conventional statistical methods (bivariate) and multivariate analysis will be used. In this way it is hoped to demonstrate relationships leading to hypotheses to be tested by analytical aetiological research.

3.2724,

EPIDEMIOLOGY OF THYROID NODULES

H. Lucot, Centre Claudius Regaud, Services de Medecine Nucleaire de Chirurgie et de Medecine, *11 Rue Piquemil, 31052 Toulouse, France*

Mortality from thyroid cancer seems more common in Midi-Pyrenees than in other regions of France. Over a period of 20 years the Claudius Regaud Center has collected a very large number of patients with thyroid nodules, many of which have been microscopically confirmed. The purpose of the study is to correlate habitat with (1) benign and malignant thyroid tumors and (2) different types of malignant tumors. The Midi-Pyrenees region is demographically rather simple. In the North, in the Massif Central range, there is an epidemiological cluster of goiters (Aveyron-Tarn) and in the South, in the Hautes-Pyrenees-Ariege range, there is another. Some of our patients come from the Aude department, between the Montagne-Noire and the Pyrenees. There are also Italian migrants (mainly from Treviso, Udine, Venice) and Spanish migrants (mainly from Aragon and Catalonia) as well as white migrants from North Africa, numerous before 1962, and Poles who migrated into mining regions around 1931. Each patient with benign and malignant thyroid nodules has been questioned about residential history, diet, familial history of thyroid disease and personal habits. The distribution of thyroid disease will be compared with that of population distribution, distinguishing between those with change of residence and others. There is a clear excess of females (83 percent of benign and 75 percent of malignant neoplasms). Follicular cancers seem to be more frequent than papillary cancers, particularly where benign lesions are common.

SUBJECT INDEX

BANGLADESH CANCER EPIDEMIOLOGY RESEARCH PROGRAM 3.1655
A STUDY OF MALIGNANCY AND OTHER ASBESTOS-RELATED DISEASES IN RELATION TO CROCIDOLITE MINING AND ENVIRONMENTAL EXPOSURE AT WITTENOOM GORGE 3.1663
LATENT PERIODS OF LUNG CANCERS IN CHRYSOTILE MINERS AND MILLERS 3.1673
LUNG CANCER MORTALITY IN ALUMINUM REDUCTION WORKERS 3.1675
CALVADOS CANCER REGISTRY 3.1681
INTERNATIONAL EPIDEMIOLOGICAL STUDY OF LUNG CANCER 3.1698
MORTALITY STUDY ON THE OCCUPATIONAL RISK OF ACRYLONITRILE PROCESSING 3.1701
EPIDEMIOLOGIC STUDIES ON MALE LUNG CANCER IN NORTHERN SWEDEN 3.1711
MORTALITY OF SMOKERS AMONG SWISS PHYSICIANS 3.1712
MINING, SMOKING AND LUNG CANCER 3.1721
AETIOLOGY OF PRIMARY SARCOMAS AND PULMONARY HAMARTOCHONDROMAS 3.1737
CIGARETTE SMOKING, THE KEROSENE STOVE AND LUNG CANCER IN HONG KONG 3.1738
COMPARATIVE EPIDEMIOLOGICAL STUDIES 3.1739
EPIDEMIOLOGICAL ASPECTS OF ASBESTOSIS AND MALIGNANT TUMORS 3.1741
A RETROSPECTIVE COHORT STUDY ON MALIGNANT NEOPLASMS IN WORKERS OF A CHROMATE MANUFACTURING PLANT IN TOKYO 3.1759
MORTALITY STUDY OF ASBESTOS FRICTION WORKERS 3.1761
CHLOROMETHYL-METHYL ETHER STUDY 3.1768
MORTALITY IN CHRYSOTILE ASBESTOS TEXTILE WORKERS - IMPLICATIONS FOR HYGIENE STANDARDS 3.1775
INVESTIGATION OF MORTALITY AND MORBIDITY PATTERNS IN CADMIUM WORKERS IN THE UNITED KINGDOM 3.1778
SECOND PRIMARIES POSSIBLY ASSOCIATED WITH CIGARETTE SMOKING 3.1779
CYTOLOGICAL SCREENING FOR LUNG CANCER USING THE SPUTUM OF WORKERS EXPOSED TO CHROMATES AND ASBESTOS 3.1789
LUNG CANCER MORBIDITY IN WORKERS EXPOSED TO INDUSTRIAL CHEMICALS 3.1794
PRIMARY LUNG CANCER INCIDENCE IN A HIGH RISK GROUP IN AN INDUSTRIAL POPULATION 3.1796
RELATION BETWEEN URBAN AND INDUSTRIAL FACTORS AND MALIGNANT NEOPLASMS IN AN UPPER SILESIAN CITY 3.1797
MASS SURVEYS OF TOKYO METROPOLITAN GOVERNMENT EMPLOYEES BY X-RAY AND IN HIGH RISK CASES BY SPUTUM CYTOLOGY 3.1813
LUNG CANCER MORTALITY AND AUTOMOBILE EMISSIONS 3.1822
RELATIONSHIP BETWEEN AIR POLLUTION AND CANCER IN JAPAN 3.1823
LUNG CANCER IN THE TAMPERE CENTRAL HOSPITAL DISTRICT 1965-1972 3.1845
CORRELATION OF AIR POLLUTION AND CANCER 3.1860
MORTALITY OF CEMENT-ASBESTOS WORKERS AFFECTED BY ASBESTOSIS 3.1870
LUNG CANCER AND AIR POLLUTION IN HAMILTON 3.1873
MORTALITY STUDY OF GLASS FIBER WORKERS 3.1877
SPUTUM CYTOLOGY RELATED TO A FOUNDRY EXPOSURE 3.1880
SPUTUM CYTOLOGY AND ASBESTOS EXPOSURE 3.1881
CYTOLOGICAL SCREENING FOR LUNG CANCER IN WORKERS EXPOSED TO HEXAVALENT CHROMIUM IN A CHEMICAL PLANT 3.1883
BACKGROUND VARIABLES IN LUNG CANCER 3.1890
CANCER INCIDENCE AMONG FERROCHROMIUM AND FERROSILICON WORKERS 3.1904
INTERACTION BETWEEN SMOKING AND ASBESTOS EXPOSURE IN LUNG CANCER AMONG CHRYSOTILE MINERS AND MILLERS 3.1906
LONG-TERM EFFECTS OF THE HEALTH STATE OF OCCUPATIONAL EXPOSURES TO CHEMICALS 3.1910
LUNG CANCER - SMOKING, RESIDENCE AND WORK PLACE EXPOSURES 3.1911
MORTALITY STUDY OF UK ACRYLONITRILE WORKERS 3.1913
MORTALITY STUDY OF FOUNDRY WORKERS 3.1914
MORTALITY STUDY OF WORKERS IN TWO SCOTTISH STEEL FOUNDRIES 3.1915
MORTALITY RISK STUDY OF COPPER SMELTER WORKERS 3.1924
LUNG CANCER - HISTOLOGY AND OCCUPATIONAL EXPOSURE 3.1926
SOME RISK FACTORS IN LUNG CANCER 3.1927
BRONCHUS CARCINOMA IN URANIUM MINERS (SCHNEEBERGER LUNGENKREBS) 3.1931
CANCER OF THE LUNG, PANCREAS AND STOMACH IN SOUTHER LOUSIANA 3.1963
PRIMARY BRONCHIAL CARCINOMA IN IRAQ 3.1965
COHORT STUDY OF LUNG CANCER AMONG MEN OCCUPATIONALLY EXPOSED TO HYDRAZINE 3.1973
EPIDEMIOLOGICAL INVESTIGATION OF AN OUTBREAK OF MESOTHELIOMA IN CENTRAL ANATOLIA, TURKEY 3.1985
EPIDERMOID AND SMALL CELL CARCINOMAS OF THE LUNG - OCCUPATIONAL DISTRIBUTION AMONG THE WORKING POPULATION OF THE RHONE-ALPES AREA 3.1986
IMMUNOLOGICAL CRITERIA IN THE DETECTION OF HIGH OCCUPATIONAL CANCER RISK AMONG TEXTILE WORKERS 3.1996
PROSPECTIVE STUDY TO DETERMINE HIGH-RISK GROUPS FOR LUNG CANCER 3.1998
MESOTHELIOMA AND OTHER MALIGNANT DISEASE IN CHRYSOTILE ASBESTOS FACTORY WORKERS 3.2008
LUNG CANCER MORTALITY IN MEN EXPOSED TO DUST 3.2011
ONTARIO MINERS STUDY 3.2015
INTERNATIONAL COOPERATIVE PROGRAM FOR COMPARATIVE STUDIES IN NEIGHBORING REGIONS OF AUSTRIA, CZECHOSLOVAKIA, HUNGARY, YUGOSLAVIA 3.2022
MALIGNANT MESOTHELIOMA OF THE PLEURA IN MONFALCONE 3.2025
CASE-REFERENT STUDY ON OCCUPATION AND LUNG CANCER 3.2031
PROSPECTIVE STUDY OF OCCUPATIONAL LUNG CANCER 3.2033
RISK FACTORS FOR MALIGANT MESOTHELIOMA 3.2047
LUNG DISEASE (INCLUDING BRONCHIAL CARCINOMA) INDUCED BY INDUSTRIAL CUTTING OILS 3.2059
SMOKING AND LUNG CANCER 3.2063
LUNG CANCER IN CUBA 3.2081
CELL TYPE DISTRIBUTION IN HISTOLOGICAL SPECIMENS OF LUNG CANCER 3.2100
LONG-TERM SPATIAL ANALYSIS OF CANCER MORTALITY IN RELATION TO DEMOGRAPHIC AND ENVIRONMENTAL FACTORS 3.2110
CANCER MORTALITY IN URBAN AND RURAL DISTRICTS OF NORTH-RHINE WESTPHALIA (WEST GERMANY) 3.2125
PROPORTION OF LUNG CANCER CAUSED BY PROFESSIONAL EXPOSURE TO CHEMICAL CARCINOGENS 3.2127
EPIDEMIOLOGICAL STUDY ON LUNG CANCER 3.2135
FOLLOW-UP STUDY ON MORTALITY OF FRESHWATER ANGLERS 3.2136
RESPIRATORY EFFECTS OF CHLOROMETHYL ETHERS 3.2159
EPIDEMIOLOGY OF HISTOLOGICAL TYPES OF LUNG CANCER 3.2160
EPIDEMIOLOGICAL STUDIES OF URANIUM MINERS AND MILL WORKERS 3.2182
TRI-COUNTY STUDY OF CANCER OF MOUTH, ESOPHAGUS, PHARYNX, LARYNX, STOMACH, COLON, RECTUM, LUNG AND BLADDER 3.2190

RISK OF NEOPLASIA IN NEIGHBORHOOD ASBESTOS DISEASE 3.2193
ASSOCIATION OF LUNG CANCER WITH CIGARETTE SMOKING 3.2201
MORTALITY EXPERIENCE OF HOUSEHOLD CONTACTS OF ASBESTOS WORKERS 3.2209
PREDICTION OF LUNG CANCER RATES BY SPUTUM CYTOLOGY 3.2210
THE PHILADELPHIA PULMONARY NEOPLASM RESEARCH PROJECT 3.2211
MORTALITY AND INDUSTRIAL HYGIENE STUDY OF ALUMINUM WORKERS 3.2216
AGE-DISTRIBUTION OF LUNG CANCER IN PATIENTS AT VETERANS ADMINISTRATION HOSPITAL - HINES, ILLINOIS 3.2220
EPIDEMIOLOGICAL STUDIES OF CANCER 3.2226
EPIDEMIOLOGICAL STUDIES OF CANCER IN LOUISIANA 3.2231
FACTORS ASSOCIATED WITH GEOGRAPHICAL DIFFERENCES IN AGE-SPECIFIC CHRONIC DISEASE DEATH RATES, INCLUDING VARIOUS SITES OF CANCER 3.2245
MORTALITY STUDY OF LEAD WORKERS 3.2249
ASBESTOS AND CANCER IN PATIENTS WITH LOW OR NO OCCUPATIONAL EXPOSURE 3.2250
CARDIOVASCULAR DISEASE EPIDEMIOLOGY IN 40,000 EMPLOYED CHICAGOANS 3.2255
CANCER MORTALITY AMONG AMERICAN INDIANS, 1968-73 3.2260
GENETIC EPIDEMIOLOGY OF CANCERS AND OTHER MAJOR CHRONIC DISEASES 3.2261
CANCER INCIDENCE IN RELATION TO A SMELTER 3.2264
PSYCHODYNAMICS OF CANCER 3.2265
STATISTICAL DATA MANAGEMENT AND COORDINATING CENTER FOR THE TYLER TEXAS ASBESTOS WORKERS PROGRAM 3.2275
INVESTIGATION OF HISTOLOGICAL TYPES OF LUNG CANCER AMONG WOMEN IN THREE ETHNIC GROUPS IN HAWAII 3.2288
EPIDEMIOLOGICAL STUDY OF THE INCIDENCE OF CANCER AS RELATED TO INDUSTRIAL EMISSIONS IN CONTRA COSTA COUNTY 3.2300
LUNG CANCER IN LOUISIANA 3.2326
HISTOLOGICAL FINDINGS IN BRONCHIAL EPITHELIUM IN RECENT AUTOPSIES 3.2334
HISTOLOGICAL CLASSIFICATION OF LUNG CANCER IN PERSONS EXPOSED TO ASBESTOS 3.2335
MORTALITY EXPERIENCE OF ACRYLONITRILE-EXPOSED WORKERS 3.2343
OCCUPATIONAL, ENVIRONMENTAL, AND PERSONAL-HABIT-RELATED DISEASES IN THE GREATER WORCESTER AREA 3.2345
MORTALITY AMONG AMOSITE ASBESTOS FACTORY WORKERS IN RELATION TO SMOKING HABITS, 1961-1977 3.2349
STUDY OF WORKERS IN A SODERBERG ALUMINUM SMELTER 3.2359
MORBIDITY AND MORTALITY PATTERNS AMONG OCCUPATIONALLY EXPOSED ASBESTOS WORKERS (ABBREV) 3.2362
LONG-TERM STUDY OF MINERS EXPOSED TO RADON-222 3.2365
ANALYSIS OF MORTALITY PATTERNS IN ALUMINUM REDUCTION PLANTS 3.2366
EPIDEMIOLOGY OF SMOKING-RELATED DISEASES 3.2377
EPIDEMIOLOGICAL STUDY OF WORKERS IN PETROLEUM REFINERIES AND PETROCHEMICAL PLANTS 3.2380
EPIDEMIOLOGY OF LUNG CANCER 3.2384
MORTALITY, MEDICAL, AND INDUSTRIAL HYGIENE STUDY OF GOLDMINERS EXPOSED TO ASBESTIFORM MINERALS 3.2396
TREND IN LUNG CANCER MORTALITY RATES IN PHILADELPHIA, PA, USA 3.2404
NORTH-EAST FLORIDA LUNG CANCER STUDY 3.2406
LUNG CANCER IN A COHORT OF WELDERS 3.2407
LEUKEMIA AND NEOPLASMS OF LUNG AND OTHER ORGANS IN A GENERAL POPULATION LIVING IN AN AREA CONTAMINATED WITH LOW LEVELS OF PLUTONIUM 3.2412
CASE-CONTROL STUDY AND OPHTHALMOLOGY SURVEY 3.2430
CASE-CONTROL STUDY OF LUNG CANCER AND DIETARY VITAMIN A IN HAWAII 3.2447
MORTALITY AND INDUSTRIAL HYGIENE STUDY OF PHOSPHATE WORKERS 3.2449
CHANGES IN LUNG CANCER INCIDENCE ASSOCIATED WITH SOCIO-ECONOMIC, DEMOGRAPHIC, AND SMOKING FACTORS AMONG CUBAN IMMIGRANTS (ABBREV) 3.2456
TWO-STAGE MODEL FOR CARCINOGENESIS 3.2466
RETROSPECTIVE COHORT MORTALITY STUDY OF MINERS EXPOSED TO AMPHIBOLE MINERAL 3.2487
NORTH-EAST FLORIDA LUNG CANCER STUDY 3.2497
HISTOLOGICAL TYPE OF LUNG CANCER AND SCAR LUNG CANCER IN ASBESTOS 3.2509
EPIDEMIOLOGICAL STUDIES OF URANIUM MINERS AND MILL WORKERS 3.2514
ASBESTOS AND CANCER 3.2516
URANIUM EPIDEMIOLOGY STUDY 3.2521
LUNG CANCER SCREENING OF WORKERS AT HIGH RISK 3.2526

CROSS SECTIONAL INDUSTRIAL HYGIENE AND MEDICAL SURVEY OF NON-TEXTILE COTTON 3.0442

REVIEW ANNUAL LITERATURE ON HEALTH EFFECTS ASSOCIATED WITH LAND APPLICATION OF WASTEWATER 3.1315

APPRAISAL OF HEALTH ASPECTS OF LAND APPLICATION OF WASTEWATER 3.1316

DISEASE TRANSMISSION ASSOCIATED WITH LAND APPLICATION OF WASTEWATER 3.1317

HEALTH EFFECTS STUDY FOR THE LUBBOCK LAND TREATMENT PROJECT 3.1321

WATER BACTERIA

(See Microorganisms; Bacteria)

WATER CHEMISTRY

(See Chemical Engineering)

WATER FOR COOKING OR DRINKING

(See Food Science and Technology; Beverages)

WATER IN THE DIET

(See Nutrition, Medical; Dietary Components)

WATER PROPERTIES

Acidity - Alkalinity - pH

INORGANIC ANALYSES TO SUPPORT EPIDEMIOLOGIC STUDIES 3.1310

Chemical Properties

GEOCHEMICAL ENVIRONMENT AND OCCURRENCE OF MALIGNANT TUMORS IN SELECTED DISTRICTS OF CZECHOSLOVAKIA 3.1481

GEOGRAPHICAL DISTRIBUTION OF CANCER MORTALITY IN IRELAND 3.1516

EPIDEMIOLOGICAL ASPECTS OF ASBESTOSIS AND MALIGNANT TUMORS 3.1741

Electrical Properties

INORGANIC ANALYSES TO SUPPORT EPIDEMIOLOGIC STUDIES 3.1310

Hardness - Softness

INORGANIC ANALYSES TO SUPPORT EPIDEMIOLOGIC STUDIES 3.1310

CANCER MORTALITY AND DRINKING WATER QUALITY 3.1677

RELATION BETWEEN URBAN AND INDUSTRIAL FACTORS AND MALIGNANT NEOPLASMS IN AN UPPER SILESIAN CITY 3.1797

ENVIRONMENTAL CORRELATIONS OF CANCER MORTALITY 3.1949

WATER QUALITY

Path of Pollutants

PCB LEVELS IN HUMAN FLUIDS - SHEBOYGAN CASE STUDY 3.0115

FOSSIL FUELS, PROCESS STREAMS AND UTILIZATION (RODENTS, RABBITS, HUMAN) 3.1080

HEAVY METALS AS ENVIRONMENTAL HAZARDS TO MAN 3.1094

DETECTION OF UNCULTURABLE ENTERIC VIRUSES 3.1311

DISEASE TRANSMISSION ASSOCIATED WITH LAND APPLICATION OF WASTEWATER 3.1317

A STUDY OF THE DISTRIBUTION AND HEALTH EFFECTS OF GIARDIA LAMBLIA IN DOMESTIC WATER SUPPLY 3.1318

INVESTIGATION OF WATERBORNE DISEASE OUTBREAKS 3.1319

SCREEN SERA FROM AEROSOL EPIDEMIOLOGICAL STUDIES FOR ANTIBODY TO LEGIONNAIRES' DISEASE BACTERIUM 3.1320

CANCER MORTALITY AND DRINKING WATER QUALITY 3.1677

Pollutant Identification

CANCER AND DRINKING WATER QUALITY IN NORTH CAROLINA 3.2483

Bioindicators

EMISSION OF REO VIRUS AS AN INDICATOR OF PATHOGENIC VIRUSES 3.0165

DETECTION OF UNCULTURABLE ENTERIC VIRUSES 3.1311

Pollution Effects

Biological Effects

EPIDEMIOLOGICAL EVALUATION OF HUMAN AND ANIMAL HEALTH AS ASSOCIATED WITH CONTAMINATED WELL WATER 3.0089

EXPOSURE LEVELS OF RURAL NORTH CAROLINIANS TO CADMIUM AND TRACE METALLIC ELEMENTS 3.0104

DOSIMETRY FOR HUMAN EXPOSURE 3.0225

MUTAGENIC/CARCINOGENIC AGENTS IN BODY FLUIDS OF CHILDREN 3.0540

THE EFFECT OF SCHOOL WATER FLUORIDATION ON DENTAL CARIES 3.1053

PREVALENCE OF DENTAL CARIES AND DENTAL FLUOROSIS IN AREAS WITH OPTIMAL AND ABOVE OPTIMAL CONCENTRATIONS OF FLUORIDE IN THEIR WATER SUPPLIES 3.1055

FOSSIL FUELS, PROCESS STREAMS AND UTILIZATION (RODENTS, RABBITS, HUMAN) 3.1080

RADIONUCLIDES IN THE ENVIRONMENT (HUMAN) 3.1087

HEAVY METALS AS ENVIRONMENTAL HAZARDS TO MAN 3.1094

ENVIRONMENTAL HEALTH SCIENCES CENTER GRANT 3.1106

TASTE OF MIXTURES 3.1109

A STUDY OF CANCER AND THE PUBLIC DRINKING WATER SUPPLIES IN MISSOURI 3.1285

CANCER INCIDENCE IN RELATION TO ASBESTOS IN DRINKING WATER IN THE PUGET SOUND AREA 3.1288

ASSESSMENT OF HEALTH IMPACT OF FILTERING ASBESTIFORM FIBERS IN DULUTH 3.1297

PROGRAM MANAGEMENT OF HEALTH EFFECTS REGARDING WASTEWATER 3.1309

DETECTION OF UNCULTURABLE ENTERIC VIRUSES 3.1311

EFFECTS OF ELEVATED LEVELS OF DRINKING WATER SODIUM ON BLOOD PRESSURES OF SCHOOL CHILDREN IN TEXAS AND OKLAHOMA 3.1312

REVIEW ANNUAL LITERATURE ON HEALTH EFFECTS ASSOCIATED WITH LAND APPLICATION OF WASTEWATER 3.1315

APPRAISAL OF HEALTH ASPECTS OF LAND APPLICATION OF WASTEWATER 3.1316

DISEASE TRANSMISSION ASSOCIATED WITH LAND APPLICATION OF WASTEWATER 3.1317

A STUDY OF THE DISTRIBUTION AND HEALTH EFFECTS OF GIARDIA LAMBLIA IN DOMESTIC WATER SUPPLY 3.1318

INVESTIGATION OF WATERBORNE DISEASE OUTBREAKS 3.1319

DEVELOPMENT OF CRITERIA FOR FRESH RECREATIONAL WATERS 3.1323

DEVELOPMENT OF PEST MANAGEMENT FOR SOIL INSECTS ON CORN 3.1324

RELATIONSHIPS BETWEEN LEAD IN HOME DRINKING WATER, CARDIOVASCULAR RISK FACTORS AND OTHER HEALTH INDICES 3.1377

GEOCHEMICAL ENVIRONMENT AND OCCURRENCE OF MALIGNANT TUMORS IN SELECTED DISTRICTS OF CZECHOSLOVAKIA 3.1481

NATURAL BACKGROUND RADIATION AND CANCER FREQUENCY IN HUMAN POPULATION GROUPS 3.1515

EPIDEMIOLOGICAL FACTORS IN GASTRIC CANCER, CLUJ DISTRICT, ROMANIA 3.1543

EPIDEMIOLOGICAL STUDIES OF THE RELATIONSHIP BETWEEN RE-USE OF WATER AND HAZARDS TO HEALTH 3.1572

GASTRIC CANCER AND NITRATE INGESTION - NITRATE IN DRINKING WATER 3.1574

CORRELATION OF WATER TRIHALOMETHANE LEVELS IN SELECTED CITIES WITH CANCER MORTALITY 3.1607

COMPARISONS OF OCCURRENCE AND LEVELS OF DRINKING WATER CONSTITUENTS AMONG PAIRS OF HIGH AND LOW CANCER MORTALITY COUNTIES IN OHIO 3.1608

A STUDY OF CANCER AND THE PUBLIC DRINKING WATER SUPPLIES IN MISSOURI 3.1615

WISCONSIN CANCER REPORTING SYSTEM - CANCER SURVEILLANCE AND RESEARCH 3.1621

EXPOSURE TO HALOGENATED ORGANIC CHEMICALS FROM DRINKING WATER 3.1623

WATER SOURCES AND CHARACTERISTICS AND RISK OF MALIGNANCIES OF SELECTED SITES IN SELECTED LOUISIANA PARISHES 3.1635

CANCER MORTALITY AND DRINKING WATER

QUALITY 3.1677
A CASE-CONTROL STUDY OF CANCER OF THE PANCREAS IN GREECE 3.1733
RELATION BETWEEN URBAN AND INDUSTRIAL FACTORS AND MALIGNANT NEOPLASMS IN AN UPPER SILESIAN CITY 3.1797
A RETROSPECTIVE STUDY OF CANCER IN RELATION TO A SPECIFIC ENVIRONMENTAL FACTOR (WATER NITRATE) 3.1907
ENVIRONMENTAL CORRELATIONS OF CANCER MORTALITY 3.1949
EPIDEMIOLOGICAL STUDY OF CEREBRAL TUMORS IN ADULTS 3.1960
CANCER MORTALITY AND WATER FLUORIDE 3.1964
EPIDEMIOLOGICAL STUDIES ON THE FREQUENCY OF TUMORS IN FISH FOUND IN POLLUTED WATERS AND THOSE FOUND IN UNPOLLUTED WATERS 3.2166
ENVIRONMENTAL INFLUENCES ON CANCER MORBIDITY IN THE PITTSBURGH REGION 3.2259
COMPARATIVE STUDY OF BLADDER CANCER IN THE U.S. AND EGYPT WITH EMPHASIS ON THE ROLE OF SCHISTOSOMIASIS IN CAUSATION OF BLADDER CANCER IN EGYPT 3.2333
EPIDEMIOLOGICAL AND THEORETICAL TOXICOLOGY STUDIES ON CHRONIC ARSENIC POISONING INCLUDING ARSENIC-INDUCED CANCERS 3.2387
DETERMINANTS OF CANCER AND CARDIOVASCULAR DISEASE MORTALITY IN ASBESTOS MINING COUNTRIES OF CALIFORNIA 3.2392
RELATIONSHIP OF PESTICIDE USE AND CANCER MORTALITY IN RURAL CALIFORNIA 3.2462
CANCER AND DRINKING WATER QUALITY IN NORTH CAROLINA 3.2483
CHEMICAL EXPOSURE STUDIES IN FLORIDA COUNTIES WITH UNUSUALLY HIGH CANCER PREVALENCES 3.2510
ANALYSIS OF URINES FOR NITROSAMINES FROM PATIENTS WITH BILHARZIASIS 3.2592

Chemical Effects

CORRELATION OF WATER TRIHALOMETHANE LEVELS IN SELECTED CITIES WITH CANCER MORTALITY 3.1607

Pollution Effects -other

PROJECTION MODELS FOR HEALTH EFFECTS ASSESSMENT IN POPULATIONS EXPOSED TO RADIOACTIVE AND NON-RADIOACTIVE POLLUTANTS 3.1338

Pollution Types

EPIDEMIOLOGICAL STUDIES ON THE FREQUENCY OF TUMORS IN FISH FOUND IN POLLUTED WATERS AND THOSE FOUND IN UNPOLLUTED WATERS 3.2166

Agricultural Pollutants

GASTRIC CANCER AND NITRATE INGESTION - NITRATE IN DRINKING WATER 3.1574
RELATIONSHIP OF PESTICIDE USE AND CANCER MORTALITY IN RURAL CALIFORNIA 3.2462

Biological Pollutants

SURVEY AND PROPHYLAXES OF ENDEMIC GOITER IN THE PROVINCE OF NORTH FRONTIER OF PAKISTAN 3.0041
DISTRIBUTION OF VIBRIOS AND RELATED SPECIES, PATHOGENIC AND NON-PATHOGENIC, IN SHELLFISH 3.0113
DISTRIBUTION, ISOLATION, & CHARACTERIZATION OF NATURAL MARINE ANTIVIRAL AGENTS (MAVAS) FROM HAWAIIAN OCEAN WATERS & OTHER PACIFIC REGIONS 3.0114
VIBRIOS AND RELATED SPECIES, PATHOGENIC AND NON-PATHOGENIC, IN SHELLFISH 3.0116
DISTRIBUTION OF VIBRIOS AND RELATED SPECIES, PATHOGENIC AND NON-PATHOGENIC, IN SHELLFISH 3.0117
EMISSION OF REO VIRUS AS AN INDICATOR OF PATHOGENIC VIRUSES 3.0165
EPIDEMIOLOGY OF INFECTION WITH ATYPICAL MYCOBACTERIA 3.0920
